Light-load Burn Rate Analysis in an Air-cooled Utility Engine Jan 02 2021 In order to maximize the power-to-weight ratio, small, air-cooled utility engines are designed for WOT performance. Low-speed, light-load conditions suffer due to high residual gas retention, poor volumetric efficiency and an unfavorable in-cylinder flow field that can lead to heat release past EVO. Conditions with significant heat release past EVO have been found to contribute as a dominant HC emissions source at low-speed and lightload. The effects of a dual spark configuration, an alternate spark location, and bulk flow improvement through swirl enhancement were investigated on a single-cylinder, air-cooled utility engine. A steady flow analysis of various swirl enhancement techniques was conducted on a steady flow bench with a swirl adaptor to obtain a global view of the intake flow angular momentum. Through in-cylinder pressure recording and exhaust gas sampling, a single-zone heat release and ring-pack model were utilized to analyze combustion and emissions performance. A similar operating condition was defined and explored to determine the light-load performance of various engine designs to isolate characteristics leading to improved performance. It was found that a dual spark configuration advances combustion leading to a reduction in burn duration, but increased burning rate only occurs when the flame fronts are held independent. With a retarded combustion phasing strategy, HC and NOX emissions were reduced independent of speed and load due to lower ring pack loading and a favorable post-oxidation environment. Conditions with significant heat release past EVO through retarded combustion phasing were found to not increase HC emissions; an oxidation reaction was still in effect. A port blockage that induced a tangential flow was found to significantly improve the part-throttle steady flow swirl coefficient leading to a greater global swirl ratio. Engine combustion tests using this blockage indicated a significant advance of combustion leading to decreased bur
